

# **ITW PHILADELPHIA RESINS RELEASE AGENT**

## **Technical Bulletin # 814A**

ITW PHILADELPHIA RESINS RELEASE AGENT prevents adhesion between most ITW Philadelphia Resins' products and surfaces of metal, glass, rubber and many plastics. It is used where the minimum possible clearance between resin and mating surface is required.

RELEASE AGENT does not contain silicone oils. When properly used the release agent coating is only a few molecules thick and there is minimal, usually zero, transfer to the cast resin.

The aerosol spray can should be held 9" to 12" from the surface and a maximum of 1 second of spray on any given area will be ample. The surface should not appear wet even when freshly sprayed.

Do not substitute other release agents for ITW PHILADELPHIA RESINS RELEASE AGENT without testing their effect on adhesion, clearance and surface bubbling.
